KYOO IL KIM  
*Michigan State University*

In Hahn (2001), an entry in Table 1 contains an algebraic mistake, and as a consequence, Theorem 1 is incorrect. The problematic entry appears in the last row of Table 1, which reads

$$E[g(z)z^5] + 2 \cdot E[g(z)z^4] + E[g(z)z^3] \\ = E\left[\frac{z^3}{(1+bz)^2(1+z)}\right] - E\left[\frac{2bz^4}{(1+bz)^3(1+z)}\right].$$

The first term on the right should be multiplied by 2, that is, it should be  $E[2z^3 / ((1+bz)^2(1+z))]$ . Related to this, the term  $r^B$  defined in the technical appendix should be changed as the last element of  $r^B$  should be  $E[2z^3 / ((1+bz)^2(1+z))] - E[2bz^4 / ((1+bz)^3(1+z))]$ . This implies that the last equation on p. 918 should read  $(1, -1, -2, -b, -1, -1-b, -b^2)r^B = 0$ , and as a consequence, there is no contradiction, contrary to the statement at the bottom of p. 918. This further implies that the conclusion of Theorem 1 is incorrect; using the same method as in the proof for Theorem 2, it can be shown that there exists a  $K(\cdot)$  with  $E[K(u)] = 0$  that satisfies the equality  $E[\ell^B | y_3, y_2 + y_1] = E[K(u) | y_3, y_2 + y_1]$  for all  $(y_3, y_2 + y_1)$ , as long as the density of the fixed effect  $u$  is bounded away from zero on an open interval. Therefore, the conditional maximum likelihood estimator is semiparametrically efficient under such conditions on the distribution of  $u$ .
